CURRENT TRENDS IN INTERNAL MIGRATION DYNAMICS IN RUSSIA

For a successful development of an economy, there is a need for vibrant labor mobility, which could secure the balance of labor supply and labor demand. In 2016, according to the Russian Federate State Statistics Service (FSSS), by attracting 12.2 million labor migrants, Russia became the second largest migrant receiving country after the United States (45 million labor migrants). Almost half of the migrants (around 6 million) are labor migrants coming to Russia mainly from the Commonwealth Independent States, particularly from Central Asia.

As for internal migration dynamics, there is a trend towards an increase in the number of people who have migrated inside Russia searching for better job opportunities and higher salaries. According to the FSSS, in 2016, over 1.2 million people migrated to another federal districts. The Central Federal District was the most popular destination for locals with 325,849 people arriving. The region has the highest net positive migration figure with 85,227 people. The North-West and Southern Federal Districts were the second and third top destinations with 184,728 and 184,612 labor migrants, respectively. On the other hand, Siberia, the North-Caucasus and Far Eastern Federal Districts were the least attracted regions for locals to relocate with 90,815, 64,182 and 56,553 people, respectively.

The direction of the internal labor migration flow indicates that people tend to move from the Eastern regions to the Western regions of the country. The outflow from the Far Eastern, North-Caucasus and Siberia Federal District is far greater than the inflow to these regions. For instance, in 2016, the North-Caucasus in terms of negative net migration takes the lead with 57,113 people, while this figure is 47,422 people for Siberia and 25,268 for the Far Eastern Federal District. Among eight federal districts except for top three performers, namely, the Central, North-West and Southern Federal Districts, the outflow of internal labor migrants is larger than the inflows.

The federal districts vary significantly in terms of unemployment rate, average salary and employment potential. In fact, the Central Federal District is a migrant attracting region not only for locals, but also for international migrants. The region attracts 45% of the international migrants arrived Russia, especially, Moscow. The region had the highest gross regional product (GRP) with 22.71 trillion rubles ($383 billion) in 2015. In addition, the district has also the second highest average salary that amount to 46,043 rubles per month ($775), which is 20% higher than the country average of 36,746 rubles per month ($619), while the average salary in Moscow reaches 71,220 rubles per month ($1200). The Central Federal District has the lowest unemployment rate and the highest employment potential among other districts. For instance, in 2016, the unemployment rate in the region totaled 3.5%, while for every 100-job announcement there was 60 registered unemployed who are relevant to the job announcement. As a result, the region has the highest net positive migration figure. Constant labor demand, higher salaries and low unemployment rate attract people to migrate to the Central Federal District.

On the other hand, the least attractive region for the domestic labor migrants is the North-Caucasus Federal District. In 2016, the region has the smallest GRP with 1.7 trillion rubles ($28.7 billion), the lowest average salary with 22,960 rubles ($386) and the highest unemployment rate with 11%. The average wage is twice and region’s GRP is 13 times less than in the Central Federal District. In addition, the region has the lowest employment potential because for every 100-job announcement there is 466 registered unemployed who are relevant to the job announcement. It could be mentioned that the combination of these negative factors reflects migration flow trends in the region, which has the highest negative net migration in 2016.

In terms of attracting migrants, the Far-East Federal District should be considered separately from the other districts. In fact, the geographical remoteness of the region supersedes its economic advantages. Although the region’s GRP is relatively low compared to many other regions, namely, 3.54 trillion rubles ($59.7 billion), the Far-East Federal District has the highest average salary totaled 46,113 rubles ($777). Moreover, the region has a low unemployment rate (5.8%), which is less than many other regions. Furthermore, the Far-East Federal District has the second-best employment potential because for every 100-job announcement; there is 63-registered unemployed who are relevant to the job announcement. However, it seems that strong macroeconomic performance of the region fails to convince migrants to settle in the district. As a result, in 2016, the Far-East District attracted less people (five times less) than the Central Federal District.

However, recent initiative of the Russian Government attempts to change this situation. On May 2, 2016, the Russian authorities endorsed the Hectare in the Far East Program, which aimed to increase the migration flow to the Far-East Federal District. The program allows the Russian citizens to obtain a hectare of land free of charge with the condition that they develop it within five years by establishing an agricultural or a farming enterprise, hotel or a house, otherwise the land will be handed back to the Government. In total, 145 million hectares were allotted by the Government for distribution under this program. So far, 95,000 people has applied and more than 21,600 plots of land are registered for new users. However, the program is still at an early stage. Therefore, taking into account the fact that there is still poor demand for free land among citizens in the region, Moscow will continue to face the depopulation of this region in the midterm.

To sum up, poor social and economic conditions and low living standards in regions, as well as the inability to find a job matching with the professional skills, are the key factors for labor migrants to consider moving other districts. As a result, the Western regions of the country attracts the Russian citizens from all other regions by serving higher salaries and low unemployment rates, while the Eastern and Southern regions of the country are losing their economically active population.
